PRODUCT DESCRIPTION

Blome CP-926 MT Moisture-tolerant Epoxy Underlayment is a three component, moisture-tolerant, epoxy-based underlayment. CP-926 MT will cure and bond to clean, cured, wet concrete. Its high tolerance for damp surfaces makes it ideal for quick turn-around projects where time does not allow for thorough drying of the surface. CP-926 MT is especially suited for use in dairy and food plant applications requiring sanitary flooring with good chemical resistance.

Blome CP-926 MT is formulated specifically for use in the Food, Beverage, and Pharmaceutical manufacturing areas where strong chemical service is expected. The material exhibits excellent bond strength to concrete and outstanding physical properties.

TYPICAL USES

Blome CP-926 is suitable for smoothing, leveling or sloping concrete slabs before the installation of Blome chemical resistant flooring systems. CP-926 is compatible with most epoxy coatings and linings, unlike latex-based underlayment systems. Blome Primer-71 secondary bonding agent must be used in conjunction with vinyl ester coatings and linings.

HANDLING CHARACTERISTICS

Blome CP-926 MT offers excellent troweling and handling characteristics. The resin and hardener are conveniently formulated for a 1:1 volumetric mix ratio. It develops strength quickly and is ideal for projects requiring a fast turn-around time. CP-926 MT can be applied at a wide range of thicknesses. For applications exceeding 2", up to 25% clean, coarse aggregate (1/8 – 1/4") can be added.

CURED

Water Absorption (ASTM C-413): < 0.05%
Adhesion to concrete (ASTM C-321): Concrete failure
Coefficient of Thermal Expansion (ASTM C-531): 15 - 17 \times 10^{-6}\text{in/in/°F}
Color: Gray
Compressive Strength @ 77°F (ASTM C-579):
- 5-6 hours - 1,000 psi
- 18 hours - 6,500 psi
- 24 hours – 10,000-11,000 psi
- Ultimate - 12,000-13,000 psi

Tensile Strength @ 77°F, 7 days (ASTM C-307) 2,500 psi
Flexural Strength @ 77°F, 7 days (ASTM C-580) 3,600 psi
Shrinkage (ASTM C-531) < 0.05%

PACKAGING & STORAGE

Blome CP-926 MT is mixed as a three (3) component product, with Resin, Hardener and 20-40 mesh sand. CP-926 MT Resin (Part A) is packaged in one-gallon cans or 4.5-gallon pails. CP-926 MT Hardener (Part B) is packaged in one-gallon cans or 4.5-gallon pails. CP-926 MT Aggregate filler (Part C) is available in 60 LB bags.

</tbody>
</table>

*Filler amounts can be varied up to 10% for desired mix consistency. For thicknesses over 2”, substitute up to 25% clean, coarse sand (1/8 – 1/4”).

Shelf life for CP-926 MT components is twenty-four (24) months if stored below 70°F at 50% relative humidity. Keep CP-926 MT components tightly sealed in original containers until ready for use. Store components in a cool, dry place, out of direct sunlight and on pallets at temperatures between 50°F–80°F. Protect bags of aggregate from water and weather while in storage and on job site.

ESTIMATED COVERAGE

One 139 LB (1.07 cu. ft.) mix of CP-926 MT covers approximately 12.8 ft² at 1” thickness. A 625 LB (4.80 cu. ft.) unit will cover approximately 57.6 ft² at 1” thickness. These are estimated coverage rates, and they do not allow for waste or other job site contingencies.
BID SPECIFICATION GUIDE

Use Blome CP-926 MT Epoxy Underlayment as manufactured by Blome International, O'Fallon, MO.

JOB SITE ENVIRONMENTAL CONDITIONS

Blome CP-926 MT must be applied while ambient temperatures are between 50°F and 90°F. Blome CP-926 MT components and substrate temperatures must also be maintained in this range. Any standing, ponding or pooled water shall be removed prior to the installation of CP-926 MT.

SURFACE PREPARATION

Concrete should be adequately cured, possess adequate integrity and not be expelling excess water of hydration. A rule of thumb for cure of new concrete is 28 days cure at 70°F but that is not an assurance that the concrete has achieved adequate physical properties. Concrete should exhibit a compressive strength of 3,000 psi minimum and tensile strength of 300 psi or higher.

Ground slabs and new concrete should be tested for excess moisture in accordance with ASTM D 4263 Plastic Sheet Test Method; any water on the backside of the sheet after overnight exposure will require additional curing before underlayment can be applied.

We recommend utilization of a low water-cement ratio, preferably 0.38 and adequate super-plasticizers for placement are recommended, particularly when cure time to coat is critical.

New concrete must also be free of curing compounds, form release agents and any other contamination that might inhibit adhesion. Old concrete must be free of existing coatings or toppings and any loose or unsound concrete must be removed.

All concrete must be cleaned, as necessary, in accordance with ASTM D 4258. The resultant surface should be free of all oil, grease, and other contamination. Consult Blome International for special procedures for oil contaminated surfaces.

Upon completion of cleaning, the concrete surface shall be prepared in accordance with ASTM D4259. The resultant surface should be free of laitance and efflorescence and have a surface texture similar to medium (60-80 grit sandpaper).

SAFETY PRECAUTIONS

Blome CP-926 MT Resin, Hardener, 20-40 Mesh Sand, and mixes of them present various health hazards if handled improperly. 20-40 Mesh Sand contains silica dust, CP-926 MT Resin and Hardener will cause eye injury and irritate skin. Wear respiratory suitable for silica dust, safety glasses with side shields, gloves and long sleeve shirts to prevent all contact with skin and eyes. After working with Blome CP-926 MT, wash thoroughly before eating, drinking, smoking or other activities.

PRIMING

Prime concrete with CP-926 MT Resin and Hardener before placing underlayment. Alternately, Primer 75 can be used for dry areas.
APPLICATION EQUIPMENT

Blome CP-926 MT is best mixed with a KOL, pail-type mixer or in a pail using a drill motor driven paddle blade. A paddle type mortar mixer is recommended when mixing large units. This mixing equipment must be clean, dry and free of any contaminants including Portland cement, other mortars or resins.

MIXING AND APPLICATION

For each two-gallon mix of resin and hardener: Mix together one gallon can Resin (Part A) and one gallon can Hardener (Part B) and blend thoroughly for 1-2 minutes. To this mixture, add up to 2 x 60 LB bags CP-926MT Aggregate, and mix to a uniform consistency. Mix components using a clean, dry mechanical mixer for a minimum of 1-2 minutes, making sure there are no lumps or dry pockets of powder. The amount of powder may be adjusted, up or down, to achieve desired consistency for specific uses. More sand will produce a stiffer underlayment consistency. For applications greater than 2", add up to 25% coarse sand (1/8-1/4") to the mix.

Pour the mixed CP-926 MT Epoxy Underlayment onto the primed concrete. Screed the material evenly using a sawing or back and forth motion. The underlayment must be tightly compacted. Finish surface with a trowel, as needed.

CLEANUP

All tools, mixing equipment, gloves and application equipment should be cleaned up immediately using a citrus or biodegradable cleanser, with hot water, while material is still wet. If material begins to cure, solvent based cleaners will be required for removal.

WARRANTY

We warrant that our goods will conform to the description contained in the order and that we have good title to all goods sold. Our material data sheets and other literature are to be considered accurate and reliable, but are used as guides only. WE GIVE NO WARRANTY OR GUARANTEE, WHETHER OF MERCHANTABILITY OR FITNESS OF PURPOSE OR OTHERWISE, AND WE ASSUME NO LIABILITY IN CONNECTION THEREWITH.
